

Plasma Assisted Combustion, Gasification, and Pollution Control

Contents

From the editor

Introduction

PAC history, applications and classification of systems (Drs. Matveev, Rosocha)

- A. Historical perspectives
- B. Applications
- C. Classification of PAC systems

Volume I. Methods of plasma generation for PAC

1. Quasi-Steady Low-Current Discharges in a Gas Flow (Prof. Korolev, Institute of High Current Electronics of the Russian Academy of Sciences)

- 1.1. General description of low-current discharges
- 1.2. Low-current plasmatron with vortex gas flow
- 1.3. Gliding arc
- 1.4. Hollow-cathode micro-discharges
- 1.5. Parallel operation of discharges in a gas flow
- 1.6. Power Supplies for Low-Current Quasi-Steady Discharges
- 1.7. Applications of low-current discharges

2. DC & AC plasma torches (Dr. Matveev, Prof. V. Frolov, Saint Petersburg State Polytechnic University)

- 2.1. Introduction (Matveev)
- 2.2. Low power DC plasma torches (Matveev)
- 2.3. High power DC plasma torches (V. Ya. Frolov)
- 2.4. DC torches with arc stabilization by liquids (Dr. Milan Hrabovsky, Czech Republic)
- 2.5. AC torches (V. Ya. Frolov)
- 2.6. PAC applications of DC plasma torches (RF torch ignition, coal ignition, waste gasification) (V. Ya. Frolov)
- 2.7. PAC applications of AC plasma torches (V. Ya. Frolov)

3. Dielectric barrier discharges & pulsed corona discharges (Dr. Rosocha, Dr. Kim, Los Alamos National Laboratory, USA)

- 3.1. Introduction
- 3.2. DBD and PCD-driven plasmas in the context of PAC
 - 3.2.1. DBD characteristics
 - 3.2.2. Effect of DBD plasma on fuel gases
 - 3.2.3. PCR characteristics
 - 3.2.4. Effect of PCD plasma on fuel gases
- 3.3. Survey of experimental/test results
 - 3.3.1. DBD PAC results
 - 3.3.2. PCD PAC results
- 3.4. Conclusions
- 3.5. References

3.6. CVs

4. Electron-beam driven plasmas for PAC and pollution control (N.V. Ardelyan, V.L. Bychkov, K.V. Kosmachevskii, Moscow State University, Rosocha LANL)

- 4.1. Principles of electron-beam plasmas.
- 4.2. Devices for electron-beam plasmas generation.
- 4.3. Devices for electron-beam-sustained plasma generation
- 4.4. Electron beam plasmas in dry air.
- 4.5. Electron beam plasmas in humid air.
- 4.6. Electron beam - nozzle plasma generator.
- 4.7. Electron-beam-sustained plasma device for combustion of propane –air mixtures
- 4.8. Control of combustion-generated pollutants using electron-beam-driven plasmas (Rosocha)
- 4.9. Conclusions
- 4.10. References
- 4.11. CVs

5. High frequency induction plasma torches (Prof. Zverev, Saint Petersburg State Polytechnic University, Dr. Matveev)

- 5.1. ICP plasma torch design features (25-35 pages)
 - 5.1.1. Introduction and history of ICP plasma torches.
 - 5.1.2. Operational principles of ICP plasma torches.
 - 5.1.3. Selection of operational parameters.
 - 5.1.4. Design, developers, and manufacturers of ICP plasma torches (vacuum, atmospheric pressure, plasma stabilization methods, etc.).
 - 5.1.5. Power supplies (vacuum tube based, solid state, prospective) for ICP plasma torches.
 - 5.1.6. Merging of ICP plasma torches and power supplies.
- 5.2. Modeling of the processes describing plasma behavior in the torches. (Prof. Ivanov, 35-45 pages).
 - 5.2.1. Introduction.
 - 5.2.2. Main assumptions.
 - 5.2.3. Main equations of the mathematical model.
 - 5.2.3.1. Energy balance equation.
 - 5.2.3.2. Motion equation.
 - 5.2.3.3. Continuity equation.
 - 5.2.3.4. Electromagnetic equations.
 - 5.2.4. Operating area and boundary conditions.
 - 5.2.5. Solution technique.
 - 5.2.6. Samples of solutions.
 - 5.2.7. Modeling of ICP torches with reverse vortex plasma stabilization.
- 5.3. Prospective systems using ICP torches (15-25 pages).
 - 5.3.1. (aerospace, spectroscopy, powders,)
 - 5.3.2. Multi-gas plasma torches.
 - 5.3.3. High-pressure plasma torches.

6. High frequency capacitive or flame torches (V.A. Vlasov, Yu.Yu. Lutsenko, A.G. Karengin, Tomsk Polytechnic University, Russia)

- 6.1. General description
- 6.2. Discharge electrodynamic model and power feeding features.
- 6.3. Plasma diagnostics and its peculiarities.
- 6.4. Specific features of the power supply and torch design.
- 6.5. Application for PAC systems.
- 6.6. Utilization of oil waste.

7. Microwave plasma torches (Dr. I. Esakov, Moscow Radio Technical Institute of the Russian Academy of Sciences, Prof. V. Bychkov, Moscow State University)

- 7.1. Experimental setups.
- 7.2. Electrode-free discharge in the overcritical MW field.
- 7.3. Initiation of air breakdown at subcritical level of MW field.
- 7.4. Subcritical MW discharges.
 - 7.4. 1. MW-initiated discharge in a supersonic air flow.
 - 7.4. 2. Subcritical MW-initiated discharge in different gases.
- 7.5. Deeply subcritical MW discharges.
 - 7.5.1. Deeply subcritical MW discharge in a submerged [What does 'submerged mean in this context?'] propane- air stream.
- 7.6. MW torches. And what?
- 7.7. Experiments on practical application of streamer type MW discharges.
 - 7.7.1. Plasma-assisted combustion applications.

8. Lasers for plasma-assisted combustion

Volume II. Plasma assisted combustion

1. Mathematical modeling and theoretical investigations of plasma-chemical combustion processes (Prof. Serbin et al, National Shipbuilding University, Ukraine, 80-90 pages)

- 1.1. Modeling of gaseous flows.
- 1.2. Modeling of liquid fuel burning.
- 1.3. Kinetic scheme of a high-temperature hydrocarbon oxidation in a plasma flow.
- 1.4. The mechanisms of pollutant formation in plasma-chemical combustion devices.
- 1.5. Thermal influence of low-temperature plasmas on liquid fuel burning.
- 1.6. The characteristics of liquid fuel gasification.
- 1.7. Investigations of plasma-chemical intensification in gas turbine combustors.

2. Plasma chemical kinetics (N.V. Ardelyan, V.L. Bychkov, K.V. Kosmachevskii, I.V. Kochetov, Moscow State University, A. Tropina, National Highway University, Ukraine)

- 2.1. Modeling of plasma jets.
- 2.2. Modeling of plasma jets in counter and cross flows.
- 2.3. Simplified model of plasma jets in propane-air mixtures in a counter flow configuration.
- 2.4. Simplified model of a plain plasma jet in a propane-air mixture in a cross flow configuration.

- 2.5. Modeling of propagation and heat effects of plasmas in thin filaments.
- 2.6. Modeling of discharge ionization processes in air, methane- and propane- air mixtures
- 2.7. Modeling of propane-air plasma assisted ignition under the influence of a non- self sustained.
- 2.8. Modeling of ignition in a methane-air mixture (Tropina).

3. Ignition (Matveev, Serbin, Tropina)

- 3.1. Ignition by low-current thermal plasma igniters. (Matveev, Serbin)
- 3.2. Igniters based on quasi-steady discharges. (Matveev)
 - 3.2.1. Atmospheric pressure igniters.
 - 3.2.2. Igniters for high pressure operation.
 - 3.2.3. Supersonic igniters.
- 3.3. Ignition by a non-equilibrium plasma of a repetitive nanosecond pulsed discharge (Tropina).
 - 3.3.1. Discharge model at atmospheric pressure conditions.
 - 3.3.2. Ignition mechanisms at atmospheric pressure and high pressure conditions.
 - 3.3.3. Ignition delay time dependence on pressure.
 - 3.3.4. Experimental facility for high pressure measurements in the internal combustion engine, operating gasoline and natural gas.
 - 3.3.5. Exhaust gas toxicity measurements in internal combustion engines equipped with non-equilibrium plasma igniters.
- 3.4. Modeling of non-equilibrium plasma assisted combustion
 - 3.4.1. Main approaches to laminar combustion.
 - 3.4.2. Minimum ignition energy evaluation for the case of non-equilibrium plasma ignition.
 - 3.4.3. Applicability of RANS models to plasma assisted combustion.
 - 3.4.4. Turbulent flame speed correction for the case of non-equilibrium plasma ignition.
- 3.5. Ignition in high speed flows
- 3.6. Laser ignition (in rocket motors, gas turbines, IC engines, Dr. Oskar Haidn, German Aerospace Center).

4. Flame control – combustion sustaining (Matveev, Serbin)

- 4.1. Plasma pilots/sustainers (Matveev)
- 4.2. Plasma fuel nozzles (PFNs) (Matveev, Serbin, Bazarov, Moscow Aerospace University)
 - 4.2.1. PFNs for gaseous fuels.
 - 4.2.2. PFNs for liquid fuels.
- 4.3. Combustors with plasma assistance (Matveev, Serbin)
 - 4.3.1. Cold flow structure in a reverse vortex combustor.
 - 4.3.2. Hot flow structure in a reverse vortex combustor with plasma assistance.
 - 4.3.3. Numerical optimization of reverse vortex combustor aerodynamic parameters.
 - 4.3.4. Investigations of a triple vortex combustor with spatial arc.
 - 4.3.5. A hybrid type plasma assisted combustion and reformation system.

5. Electrically enhanced combustion (Min Suk Cha and Suk Ho Chung, KAUST)

- 5.1. Introduction

- 5.2. Ion movement in electric fields
 - 5.2.1. Electric field with DC
 - 5.2.2. Electric field with AC
- 5.3. Recent development for flame augmentation by electric fields
 - 5.3.1. Enhancement of flame stability
 - 5.3.2. Enhancement of flame propagation speeds
 - 5.3.3. Modeling of electric field effects
- 5.4. Summary
- 5.5. References

6. Plasmas for fuel activation and conversion (Rosocha, Y-H Kim, LANL, Yu Korolev, IHCE)

- 6.1. Introduction
- 6.2. Representative plasma processors
 - 6.2.1. Dielectric barrier discharges
 - 6.2.2. Pulsed corona discharges
 - 6.2.3. Plasmatron discharges
 - 6.2.4. RF discharges
- 6.3. DBD and PCD Plasma chemistry in the context of PAC
 - 6.3.1. Fuel decomposition
 - 6.3.2. Fuel activation
 - 6.3.3. Fuel conversion
- 6.4. Survey of experimental/test results
 - 6.4.1. DBD results
 - 6.4.2. PCD results
 - 6.4.3. Plasmatron results
 - 6.4.4. RF results
- 6.6. Conclusions
- 6.7. References

7. Plasma thermal and chemical treatment of coals for start up of the coal fired boilers (Dr. V. Peregudov, Siberian Branch of the Russian Academy of Sciences)

- 7.1. Efficiency of plasma ignition processes.
- 7.2. Experimental investigations of coal ignition.
- 7.3. Influence of the technological parameters of coal thermal and chemical treatment on power consumption at plasma ignition.
- 7.4. Power rate definition for plasma ignition.
- 7.5. Plasma coal burners.
- 7.6. Plasma torches for coal ignition.
- 7.7. Plasma thermal and chemical treatment for control of pollutants from coal combustion.
- 7.8. Plasma ignition solutions for coal fired boilers.

8. Gasification (Matveev; Serbin; Trusov, Moscow State Technical University; Carabin, Pyrogenesis, Canada; Hrabovsky, ASCR)

- 8.1. Thermodynamic model of the coal gasification processes (Professor B. Trusov, MSTU)
 - 8.1.1. Calculations of the equilibrium state parameters for complicated systems.

- 8.1.2. Characteristics of the gasification process products and their specific power consumption values.
- 8.1.3. One-dimensional hydrodynamic model of a gasifier.
- 8.1.4. Thermodynamic description of a kinetics of chemical conversions in a gas phase.
- 8.2. Partial gasification.
- 8.3. Complete gasification.
 - 8.3.1. Modeling.
- 8.4. Prospective plasma coal gasification systems.
- 8.5. Waste gasification (Pierre Carabin et al, Pyrogenesis Canada)
 - 8.5.1. Waste gasification chemistry
 - 8.5.2. Comparison between low temperature gasification and plasma gasification
 - 8.5.3. Plasma gasification reactors and furnaces
 - 8.5.4. Syngas cleaning options
 - 8.5.5. Energy production options
 - 8.5.6. Syngas upgrading options: chemicals, synthetic fuels
 - 8.5.7. Emissions from gasification systems
 - 8.5.8. Commercial plasma waste gasification processes
 - 8.5.9. The future of plasma waste gasification – new developments
- 8.6. Bio-mass gasification (Dr. Milan Hrabovsky, Institute of Plasma Physics ASCR, Czech Republic)

9. Pollution control using plasmas (Rosocha, Y-H Kim, LANL)

- 9.1. Introduction
- 9.2. Representative plasma processors
 - 8.2.1. Dielectric barrier discharges
 - 8.2.2. Pulsed corona discharges
- 9.3. Plasma chemistry, active species production and decomposition chemistry
 - 8.3.1. Plasma chemistry in context of PAC
 - 8.3.2. Main mechanisms for active species production
 - 8.3.3. Major pollutant decomposition pathways
- 9.4. Survey of experimental/test results
 - 8.4.1. DBD results
 - 8.4.2. PCD results
- 9.5. Scaling relationships, economics & figures of merit.
 - 8.5.1. Plasma reactor scale up architectures
 - 8.5.2. Scaling rules
 - 8.5.3. Process economics and figures of merit
- 9.6. Conclusions
- 9.7. References
- 9.8. CV for L. Rosocha

Each chapter will have a reference list, photos of contributing authors, and their short CVs.
